

Arrivio B2B — Services Feature

Implementation Specification for Codex

Prepared by: Arrivio Dev Team **Date:** May 21, 2026 **Status:** Ready for Implementation **Version:** MVP v1.0

Table of Contents

1. [Overview](#)

 12. [TBD / Post-MVP](#)
-

1. Overview

Add a **Services** feature to the Arrivio B2B Partner Platform. This allows HR admins and company administrators to browse, request, and track relocation services for their employees — either individually or in bulk.

The feature is inspired by the existing B2C services flow (see Section 4 — Visual Reference) but adapted specifically for B2B use cases: multi-employee ordering, per-employee customization, and centralized order tracking.

Entry points:

- A **Services strip** on the main dashboard (quick discovery)
- A **Services nav item** in the sidebar (primary navigation)

Both lead to the same full Services page.

2. Tech Stack

Layer	Technology
Frontend Framework	React 19 + Vite
Styling	Tailwind CSS
Icons	Lucide React
Animations	Framer Motion
HTTP Client	Axios
Backend	Node.js + Express.js
Database	PostgreSQL via Supabase
Auth	Supabase Auth
Storage	Supabase Storage

3. Before You Write Any Code

This is the most important section. Read it fully before doing anything else.

This feature is being added to an existing B2B codebase. Before writing a single line of code, Codex must:

3.1 Read and Understand the Codebase

- **Explore the full project structure** — understand how folders are organised, where pages live, where components live, where API routes are defined
- **Read at least 2-3 existing page components** to understand the coding style, how state is managed, how Axios is used, how props are structured
- **Read the existing sidebar/navigation component** — understand exactly how nav items are added so the new Services item follows the same pattern precisely
- **Read the existing dashboard page** — understand the layout structure so the Services strip is inserted correctly without breaking existing sections
- **Read existing modal components** if any exist — follow the same pattern for the Request Modal

- **Read existing backend route files** — follow the same structure, middleware usage, error handling, and response format already established
- **Read existing Supabase schema or migration files** — understand existing table structures, naming conventions, and foreign key patterns before creating new tables

3.2 Follow Existing Conventions — Always

- **File naming:** match whatever convention is already used (PascalCase, camelCase, kebab-case)
- **Folder structure:** place new files exactly where similar existing files are placed
- **Component patterns:** if existing components use a certain prop pattern, hooks pattern, or state management approach — replicate it
- **API patterns:** match the existing route structure, middleware chain, and response format
- **Styling:** use the same Tailwind class patterns already used in the codebase — do not introduce new design tokens or override existing ones
- **Database:** follow the existing table naming conventions, column naming style, and foreign key references

3.3 Do Not Assume

- Do not assume folder paths — read the codebase first
- Do not assume table names — check existing Supabase schema first
- Do not assume how auth/session works — read existing authenticated routes first
- Do not assume how `company_id` or `employee_id` is stored — read existing data models first

4. Visual Reference

The following screenshots are attached to this document and should be used as **functional reference only** — not as a design template. The B2B implementation must follow the B2B platform's existing design language, not the B2C design.

Attached Screenshots

Screenshot	What it shows
<code>screenshot-1-dashboard.png</code>	B2C dashboard with the Popular Services strip — reference for strip placement and card layout concept
<code>screenshot-2-services-page.png</code>	B2C full services page — reference for category filters, service cards grid, and Browse/My Orders toggle

Screenshot	What it shows
 screenshot-3-request-modal.png	B2C request modal — reference for the modal's functional elements (quantity, special requests, confirm)
 screenshot-4-my-orders.png	B2C My Orders tab — reference for order list layout, status badges, and tab structure

How to Use These Screenshots

- Use them to understand **what** each screen should do and **what elements** it should contain
- Do **not** copy the B2C visual style — colours, fonts, spacing, and component shapes must match the existing B2B platform
- The B2B platform uses a dark sidebar, white content area, and Arrivio green as the primary accent — stay consistent with that

5. Navigation Changes

Current Sidebar Structure

MENU

- Dashboard

- Properties

- Employees

FINANCIAL

- Billing

- Invoices

- Payments

Updated Sidebar Structure

MENU

- Dashboard

- Properties

- Employees

- Services ← ADD THIS

FINANCIAL

- Billing

- Invoices

- Payments

Implementation notes:

- Read the existing sidebar component before making changes
- Follow the exact same pattern used to add existing nav items (icon, label, route, active state)
- Use a relevant Lucide icon (suggestion: `Briefcase` or `ShoppingBag`) — choose whichever fits better visually)
- Route: follow the existing routing convention in the codebase (e.g. `/dashboard/services` or whatever pattern is used)
- Active state must match the existing sidebar active item style exactly

6. Services Catalogue

These are the 7 services available in MVP. Pricing is placeholder and will be updated by the Arrivio team before go-live.

#	Service Name	Category	Placeholder Price	Description
1	Airport Pickup	Transport	€89	Private transfer from any German airport to the employee's new address
2	Housing	Housing	€199	Assisted housing search and placement support for relocating employees
3	Bank Account	Banking	€29	Guided bank account opening appointment at a partner bank
4	Insurance	Insurance	€49	Health insurance comparison, selection, and enrollment support
5	SIM Card	Connectivity	€15	Pre-activated German SIM card with data plan delivered to the employee
6	Anmeldung Support	Legal	€39	Assisted appointment booking and guidance for official German address registration
7	Tax ID Guidance	Legal	€25	Step-by-step support for obtaining the German Tax Identification Number (Steuer-ID)

Category Tags

`Transport` · `Housing` · `Banking` · `Insurance` · `Connectivity` · `Legal`

7. Screen Specifications

7.1 Dashboard Services Strip

Location: Main dashboard page, placed **below the stats cards** (Active Properties, Total Employees, Monthly Spend) and **above the Recent Activity** section.

Purpose: Quick discovery of available services. A teaser strip — not the primary entry point.

What it should contain

- Section heading: "Popular Services"
- Sub-label: "Help your employees settle in faster"
- A "View All →" link on the right of the heading — navigates to the full Services page
- **4 service cards** in a horizontal row (responsive: 4 columns desktop, 2 tablet, 1 mobile)
- Suggested featured services: **Airport Pickup, SIM Card, Bank Account, Anmeldung Support**

Each card should show

- Service icon (use an appropriate Lucide icon per service)
- Category tag (small, muted)
- Service name (bold)
- Short description (1 line, truncated if needed)
- Price
- **REQUEST** button

Behaviour

- Clicking **REQUEST** opens the Request Modal for that service
- Clicking anywhere else on the card navigates to the full Services page

Implementation note

- Read the existing dashboard layout carefully before inserting this section
 - Match the heading style used by other dashboard sections (e.g. "Onboarding Status")
 - Follow existing card patterns in the codebase if any exist
-

7.2 Full Services Page

Accessible via: Sidebar nav item OR "View All" from dashboard strip

Page Header

- Title: "Services"
- Subtitle: "Everything your employees need to settle into life in Germany"

Tab Toggle

Two tabs at the top:

- **BROWSE SERVICES** (default active)
- **MY ORDERS** (with a count badge showing active orders if > 0)

Follow the existing tab/toggle pattern used elsewhere in the B2B codebase.

Category Filter Bar (Browse Services tab)

Horizontally scrollable filter chips:

ALL (7) · TRANSPORT (1) · HOUSING (1) · BANKING (1) · INSURANCE (1) · CONNECTIVITY (1) · LEGAL (2)

- **ALL** selected by default
- Clicking a category filters the service cards
- Active filter: filled Arrivio green, white text
- Inactive: outlined, muted text

Service Cards Grid

- 3-column grid desktop, 2 tablet, 1 mobile
- Each card: category tag, service icon, service name, description, price, **REQUEST** button

Bundles Section

- Below the service cards grid
 - Heading: "Relocation Packages"
 - Sub-label: "Pre-bundled services for a complete relocation experience"
 - Bundle cards (see Section 8)
-

7.3 Request Modal

Triggered when HR admin clicks **REQUEST** on any service card.

Modal Header

- Service icon, category tag, service name, description, price

Step 1 — Choose Recipients

Two options displayed as selectable cards or a segmented control:

Option A — All Employees

- Order applies to all employees under the company
- Show a count: e.g. "48 employees will receive this service"
- Read how employees are fetched/stored from existing code before implementing

Option B — Select Specific Employees

- Searchable multi-select dropdown
- Each employee shown as: [Avatar initial] Full Name · Job Title
- Selected employees shown as removable tags

Step 2 — Per-Employee Customization

Only shown when Option B is selected AND more than one employee is chosen.

A collapsible accordion — one row per selected employee. When expanded, shows a small form with fields relevant to the service:

Service	Fields
Airport Pickup	Pickup date, Pickup time, Flight number (optional)
Housing	Preferred city/area, Move-in date, Duration (months)
Bank Account	Preferred appointment date
Insurance	Coverage preference, Start date
SIM Card	Delivery address
Anmeldung Support	Appointment date preference, Current address
Tax ID Guidance	Preferred contact method

If HR does not customize a row, default/blank values apply.

Step 3 — Additional Details

- Quantity stepper (− / number / +)
- Special requests text area (optional)

Modal Footer

- CANCEL (outlined) and CONFIRM (Arrivio green) buttons

- On confirm: success toast, modal closes, My Orders badge updates
- Confirm disabled until a recipient is selected

Implementation note

- Read existing modal components in the codebase and follow the same pattern
 - Do not create a new modal system if one already exists
-

7.4 My Orders Tab

Filters

1. **Status tabs:** ACTIVE · DELIVERED · CANCELLED (each with a count badge)
2. **Employee filter dropdown** (right-aligned): All Employees + individual employee names

Order Row

Each order shows:

- Service icon
- Service name (bold)
- "For: [Employee Name]" or "For: All Employees"
- Order date
- Price (right-aligned)
- Status badge: PENDING (amber) · ACTIVE (green) · DELIVERED (blue) · CANCELLED (muted)
- Sorted by date descending
- Empty state with a friendly message and CTA to browse services

MVP Payment Note

All confirmed orders are created with PENDING status. Payment is handled manually by the Arrivio ops team. **Do not implement any payment UI for MVP.**

8. Service Bundles

Pre-defined relocation packages curated by Arrivio. Shown in a dedicated section on the Browse Services tab.

MVP Bundles (Placeholder — confirm with Arrivio team before go-live)

Bundle Name	Included Services	Placeholder Price
Starter Pack	SIM Card + Bank Account	€40
Relocation Essentials	Airport Pickup + Anmeldung Support + SIM Card	€130
Full Relocation Package	All 7 services	€440

Bundle Card

- Bundle name, short description
- Included services shown as small icon + name chips
- Bundle price (show savings vs individual if possible)
- REQUEST BUNDLE

 button

Bundle Request Flow

Same modal as individual service request (Section 7.3). Each service in the bundle creates a separate order row in My Orders, linked by a shared bundle reference ID.

Future Enhancement — Phase 2

Custom bundle builder: allow HR admins to create their own service combinations. **Do not implement in MVP.**

9. Backend Requirements

General Instructions

- Read existing Express route files before creating new ones
- Follow the same middleware, auth verification, error handling, and response format already in use
- All new routes must be protected — only authenticated users with the correct company role can access them
- Orders must always be scoped to the authenticated user's

company_id

 — read how this is handled in existing routes

Required Endpoints

Method	Endpoint	Description
GET	/api/services	Fetch all active services

Method	Endpoint	Description
GET	/api/services/bundles	Fetch all active bundles
POST	/api/orders	Create one or more service orders
GET	/api/orders	Fetch all orders for the company (filterable by status, employee)
GET	/api/orders/:id	Fetch a single order by ID
PATCH	/api/orders/:id/status	Update order status (for Arrivio ops/admin use)

Adjust route paths to match existing API conventions in the codebase.

10. Database Schema

General Instructions

- Read existing Supabase migration files or schema before creating new tables
- Follow existing naming conventions (snake_case assumed but verify)
- Use existing `companies` and `employees` table names and foreign key references — do not create duplicate tables
- Add RLS (Row Level Security) policies consistent with how existing tables are secured

New Tables Required

`services`

Stores the service catalogue.

Columns needed:

- Unique ID (primary key)
- Name
- Description
- Category
- Price
- Icon identifier (maps to a Lucide icon name)
- Active/inactive flag
- Created timestamp

`service_bundles`

Stores pre-defined bundles.

Columns needed:

- Unique ID (primary key)
- Name
- Description
- Total price
- Active/inactive flag
- Created timestamp

bundle_services (junction table)

Links bundles to their included services.

Columns needed:

- Bundle ID (foreign key → service_bundles)
- Service ID (foreign key → services)
- Composite primary key on both

service_orders

Stores all placed orders.

Columns needed:

- Unique ID (primary key)
 - Company ID (foreign key → existing companies table)
 - Service ID (foreign key → services)
 - Bundle reference ID (nullable — groups bundle orders together)
 - Employee ID (nullable — NULL means "All Employees", foreign key → existing employees table)
 - Quantity
 - Special requests (text, nullable)
 - Custom fields (JSON — stores per-employee customization data)
 - Status (pending / active / delivered / cancelled)
 - Ordered timestamp
 - Updated timestamp
-

11. API Endpoints

General Response Format

Follow the exact response format already used in the existing API. Read existing route handlers

to confirm the structure before implementing.

POST /api/orders — Key Request Fields

The order creation endpoint must handle:

- `service_id` — which service is being ordered
- `recipient_type` — `"all"` or `"specific"`
- `employee_ids` — array of employee IDs (used when `recipient_type` is `"specific"`)
- `quantity` — number per employee
- `special_requests` — optional free text
- `custom_fields` — object keyed by employee ID, containing per-employee customization data

When `recipient_type` is `"all"`, the backend should fetch all active employees under the company and create an order row for each one (or a single order with a null `employee_id` — decide based on what makes the My Orders view easier to query).

GET /api/orders — Supported Filters

- `status` — filter by order status
 - `employee_id` — filter by specific employee
 - Pagination (follow existing pagination pattern in the codebase)
-

12. TBD / Post-MVP

The following are intentionally out of scope for MVP. Do not implement. They are documented here for future reference.

Item	Notes
Payment flow	To be confirmed — consolidated monthly invoice vs direct Stripe/Cashfree payment. Add a payment step to the Request Modal once confirmed.
Bundle definitions	Placeholder bundles in Section 8 need to be confirmed with the Arrivio team before go-live.
Custom bundle builder	Allow HR admins to create their own service combinations. Phase 2 only.
Employee notifications	Email / WhatsApp (Twilio) notifications to employees when a service is ordered for them.
Arrivio Ops order management	Admin-side view to manage and update order statuses across all companies.
Reporting	Service usage analytics per company (total spend on services, most ordered services, etc.)

This document is intended for Codex implementation. Codex must read and understand the existing codebase before writing any code, and must follow all existing conventions found there. Placeholder values (pricing, bundle definitions) must be replaced with confirmed figures before production deployment.
